Entry # 2

Date Range: April 9 – April 17, 2026

1. Current Progress & Goals

April 9:

- improved the CSS styling for movie posters when users click the movie covers (thumbnails)
- adjusted image sizes, borders, and spacing
- fixed alignment issues of poster previews

April 10-12:

- tried different theme color combinations for the movie website
- updated background colors, fonts, and buttons
- improved the overall look of the interface
- improved hover effects for movie thumbnails
- improved the CSS layout
- adjusted margins, padding, and font sizes

April 14-17:

- reviewed and improved the overall design of the CineSearch website
- checked consistency of themes, posters, and navigation
- finalized styling improvements after testing

My main objective for this week was to improve the visual presentation and interaction of the movie posters on the CineSearch website. I focused on enhancing the CSS styling of the movie thumbnails when users click on the movie covers, experimenting with different themes that better match the website design, and improving responsiveness across various screen sizes.

I successfully refined the poster layout, improved hover effects and animations, tested different theme styles, and optimized the CSS structure. These tasks helped make the website more visually consistent, interactive, and user-friendly.

2. Challenges & Roadblocks

- One of the challenges I encountered was adjusting the CSS styling for movie posters so that the layout remained consistent across different screen sizes. Some elements overlapped or appeared misaligned when viewed on smaller screens. I also had difficulty choosing a theme color scheme that matched the movie website concept while maintaining readability and visual balance. All required careful testing and adjustments.

3. Problem Solving & Pivots

- To address these challenges, I tested different CSS properties to make sure the poster layout worked properly on different screen sizes. I also tried different theme color combinations until I found a design that looked better for the website.
- Through this process, I learned the importance of consistent styling, testing responsive design, and organizing CSS code properly. I also became more confident in fixing layout issues and improving the overall user interface.

4. Discussion of Next Steps

For the next session, my specific goals are to:

- Further improve the responsiveness of the movie poster layout.
- Enhance user interaction by adding more animations or transitions.
- Continue refining the theme and visual consistency of the website.
- Begin integrating additional features to improve the functionality of the CineSearch website.

These goals will help me improve the overall quality and functionality of the CineSearch website by making it more responsive, interactive, and visually consistent. The quality will also help me ensure that the design supports a better user experience and that the system continues to develop into a more efficient and reliable movie search platform.
